RE: Fourth Quarter 2008 Groundwater Monitoring Report
Former Mission Linen Supply Facility
11904-11920 East Washington Boulevard, Santa Fe Springs, California
SLIC Case No. 713

Dear Mr. Zaidi:

On behalf of Mission Linen Supply, CGC Environmental, Inc. is submitting this fourth quarter 2008 Groundwater Monitoring Report for the above-referenced facility.

If you have any questions or need additional information, please contact me at (562) 592-0134 or Donald Moore at (415) 566-0300.

Sincerely,

CGC Environmental, Inc.

A handwritten signature in black ink that reads "Norman D. Colby".

1 Introduction

This report presents the results of quarterly groundwater monitoring activities for the fourth quarter 2008 conducted by CGC Environmental, Inc. (CGC) at the former Mission Linen Supply (Mission) facility located at 11904-11920 East Washington Street, Santa Fe Springs, California (the site; Figure 1). Quarterly monitoring is being performed pursuant to a Los Angeles Regional Water Quality Control Board (RWQCB) directive dated November 2, 2000 and is a component of ongoing assessment and restoration activities at the site designed to assess and remediate subsurface chlorinated volatile organic compound (VOC) contamination.

This quarterly groundwater monitoring report summarizes the fourth quarter groundwater gauging and sampling activities conducted on November 10, 2008.

2 Background

The site is located in an industrial/commercial area of Santa Fe Springs. In 1973, Mission purchased the site from the former owners who operated the Whittier Laundry Company. Mission conducted dry cleaning and industrial laundry operations there until 1982. In 1982 Mission acquired the adjacent property (11904-11906 East Washington Boulevard). All laundry and dry cleaning operations took place at the 11920 East Washington Boulevard address. In 1993, Mission had all buildings removed. The properties are currently vacant.

Mission removed five underground storage tanks (USTs) from the site in 1987. These tanks stored gasoline, diesel fuel and waste oil. Some hydrocarbon-impacted soil was identified during the tank removal project. Contaminated soil was excavated from the tank areas. In May 1994, the former UST locations were issued environmental closure by the County of Los Angeles Department of Public Works.

In 1996, Mission contracted National Environmental Consultants, Inc. (NEC) to complete an onsite soil gas survey. The soil gas assessment was performed to determine if VOCs were present in subsurface soils underlying the site. Tetrachloroethene (PCE) was detected by the soil gas survey. Follow-up soil and groundwater sampling by NEC and Dames and Moore identified PCE and other VOCs in soil and groundwater underlying the site. Rincon Consultants completed a soil gas survey at the site and adjacent properties to the south in December 2000. On July 26, 2001, a soil vapor extraction test was performed at the site. The findings of the assessment and pilot test were summarized in a report titled "Pilot Test Interpretation Report" prepared by Rincon Consultants and submitted to the RWQCB on September 7, 2001.

The Source Group, Inc. (SGI) installed six dual-nested vapor extraction (SVE) wells during the first quarter of 2005 for a soil vapor extraction and treatment system along with two groundwater monitoring wells for use in aquifer testing and enhanced in-situ bioremediation (EISB) pilot testing. SGI successfully completed aquifer testing in August 2005 and operated the SVE system from August 2005 to September 2007. SGI conducted an EISB injection event in the source area near wells MW-2 and MW-3 in December 2006. Results of these remediation activities are discussed in Section 7.2. A total of seven wells are currently monitored quarterly. Three piezometers previously installed at the site have been abandoned.

3 Site and Regional Hydrogeology

A brief summary of site hydrogeology and regional hydrogeology is presented below.

3.1 Site Hydrogeology

The site is located within the coastal plain of Los Angeles County. The site is located about 1.5 miles east of the San Gabriel River and about 2 miles southwest of the Puente Hills. Topography across the site is generally flat.

Sediments underlying the site are comprised of a series of non-marine and marine transported deposits of sand, silt and clay. The near-surface sedimentary materials are primarily deposits of the San Gabriel River and its tributaries and consist of silt, sand and some gravel. The river system originates in the San Gabriel Mountains, northeast of the site, and extends to the Pacific Ocean. The San Gabriel River flows through the Whittier Narrows, a geographic gap between the Puente Hills and the Montebello Hills.

Near-surface sediments have been drilled and sampled during the course of site activities completed at the site. The near-surface sediments consist of silt, sand and some gravel to a depth of about 50 feet below ground surface (bgs). Historically, groundwater has been measured in onsite groundwater monitoring wells at depths of approximately 23 to 39 feet bgs. The depth to groundwater has fluctuated over time. For example, the depth to groundwater in wells MW-1 through MW-3 increased from about 25 to 26 feet bgs in December 2000 to approximately 38 feet bgs in August 2004. However, depth to groundwater decreased significantly (approximately 8 to 10 feet) in most of the site monitoring wells since the second quarter of 2005, likely due to the heavy winter precipitation that the region experienced during that time. Water levels remained relatively stable between 2005 and late 2007, but depth to groundwater has increased markedly during 2008. The direction of groundwater flow is typically to the southwest.

3.2 Regional Hydrogeology

Information regarding the groundwater aquifers in the area of the site was obtained from Department of Water Resources Bulletin 104 (1988). The site is located at the eastern edge of the Montebello Forebay Area and the western edge of the Whittier Area in the coastal plain of Los Angeles County. The site is located within the La Habra Piedmont Slope located south of Puente Hills. Recent alluvium is present near the

ground surface and the Gaspur Aquifer is present within a depth of 50 feet bgs. The Gardena Aquifer is present within a depth of 150 feet bgs and the Lynwood Aquifer is present within depths of 200 to 300 feet bgs. The Silverado Aquifer is located approximately 350 to 500 feet bgs and the Sunnyside Aquifer is located greater than 500 feet bgs.

Although the Bellflower Aquiclude is not depicted in Cross Section N-N' of Bulletin 104, the presence of the aquiclude has been identified beneath the subject property on isopach maps of the different water-bearing units (Bulletin 104). The aquiclude consists of clays and silty clays. The depth to the base of the Bellflower Aquiclude in the vicinity of the subject property is approximately 120 feet above mean sea level (msl). The ground elevation of the subject property is about 155 feet above msl, thus, pursuant to Bulletin 104, the depth to the base of the Bellflower Aquiclude at the subject property is about 35 feet bgs. This depth of the base of the Bellflower coincides with the base of a silty zone that was encountered onsite, which extends from about 15 to 30 feet bgs.

The nearest surface water bodies to the site are the Sorensen Drain and the San Gabriel River. The Sorensen Drain is located approximately 2,400 feet to the southwest of the site and flows southeast to La Cañada Verde Creek. The San Gabriel River is located approximately 7,200 feet (1.4 miles) to the northwest of the site and flows to the southwest.

4 Groundwater Monitoring and Sampling

Methods for measuring depth to water, collecting groundwater samples, and performing laboratory analysis are presented below.

4.1 Depth to Water Measurements

The depth to static groundwater was measured prior to sampling in monitoring wells MW-1 through MW-5, MW-7 and MW-8 on November 10, 2008. Water-level data was recorded on the well gauging data forms and well monitoring data sheets (Appendix A). The location of each groundwater monitoring well is shown on Figure 2. Construction details for the groundwater monitoring wells are presented in Table 1.

4.2 Groundwater Sampling

During this quarterly monitoring period, groundwater samples were collected from a total of five monitoring wells. Groundwater samples were collected on November 10, 2008 from monitoring wells MW-3, MW-4, MW-5, MW-7 and MW-8. Insufficient groundwater was present in wells MW-1 and MW-2 to collect samples this quarter. Insufficient groundwater was present in MW-3 to purge the well, but a grab groundwater sample was obtained. Groundwater samples and water level data were collected in general accordance with United States Environmental Protection Agency (EPA) sampling guidance.

A 2-inch diameter Grundfos submersible electric pump with new tubing was used for low-flow (approximately 100 ml/min) purging of each monitoring well (with the exception of well MW-3 as noted above). During purging the pH, temperature, specific conductance, turbidity, oxidation-reduction potential (ORP) and dissolved oxygen of purge water were monitored with in-line meters and recorded on the sampling forms. Qualitative observations were also recorded. Purging continued until stabilization of water quality parameters (± 0.1 units for pH and $\pm 3\%$ for specific conductance) was achieved. These parameters were measured to assess the stability of extracted groundwater. Stable field parameter measurements tend to indicate that the groundwater samples collected will be representative of in-situ groundwater conditions. Field measurement instruments were calibrated daily prior to their use. The recorded field measurements are included on the well monitoring data sheets presented in Appendix A. The instrument calibration data is presented on the Test Equipment

Calibration Log (Appendix A). Monitoring well purge water is being stored onsite in labeled 55-gallon drums until proper disposal is arranged.

In addition to the samples collected from the five wells, a duplicate sample (MW-DUP) was collected from monitoring well MW-5 for quality control (QC) purposes to assess the reproducibility of laboratory results. Included in the laboratory report (Appendix B) is a sample receipt checklist indicating the condition of the sample containers and cooler upon arrival at the laboratory. This form indicates that the samples arrived intact and within the prescribed EPA temperature range of 4 degrees Celsius ($^{\circ}\text{C}$) $\pm 2^{\circ}\text{C}$ during storage and transport.

4.3 Laboratory Analysis

Samples collected during this quarterly monitoring event were submitted to TestAmerica Laboratories, Inc. (STL) of Pleasanton, California, a State-of-California certified analytical laboratory following chain of custody protocols. All groundwater samples collected this quarter were analyzed for VOCs using EPA Method 8260B. Copies of laboratory reports and chain of custody records are included in Appendix B.

5 Results of Water-Level Measurements

Depth to water measurements in monitoring wells this quarter ranged from 37.43 feet below top of casing (btc) to 40.95 feet btc in wells MW-8 and MW-4, respectively. The calculated water surface elevations in this zone ranged from 113.77 feet above msl to 114.50 feet above msl. Very little water was present in wells MW-1 and MW-2 this quarter, so the groundwater elevations calculated for these wells may not be representative of the aquifer. The average groundwater elevation calculated this quarter was 2.49 feet lower than the previous quarter (August 2008).

The depth to water measurements and calculated groundwater elevations in each monitoring well this quarter are presented in Table 2. Historical groundwater elevations are listed in Appendix C. A groundwater contour map illustrating the interpreted potentiometric surface for this quarterly monitoring period is presented on Figure 3. As this figure illustrates, the direction of groundwater flow is generally to the southwest, although some slight mounding was observed in the east-central portion of the site this quarter. The average hydraulic gradient is approximately 0.001.

6 Results of Chemical Analyses

The following sections summarize the analytical results of the groundwater samples obtained as part of this quarterly monitoring event. The analytical results of groundwater samples collected in November 2008 (fourth quarter 2008) are listed in Table 3. The distribution of analytes detected is shown on Figure 4. Historical analytical results are presented in Appendix D. Laboratory reports are included in Appendix B. Time-series plots of VOCs in site monitoring wells are included in Appendix E.

6.1 Chlorinated Volatile Organic Compounds

Four chlorinated VOCs were detected in groundwater samples obtained from groundwater monitoring wells at the site during this monitoring period. These VOCs are tetrachloroethene (PCE), trichloroethene (TCE), cis-1,2-dichloroethene (cis-1,2-DCE) and 1,1-dichloroethene (1,1-DCE). No other VOCs were detected in groundwater samples collected this quarter.

6.1.1 Tetrachloroethene

PCE was detected in each of the five monitoring wells sampled this quarter at concentrations ranging from 0.70 micrograms per liter ($\mu\text{g}/\text{L}$) in well MW-4 to 610 $\mu\text{g}/\text{L}$ in well MW-5. Four of the five PCE detections this quarter are above the EPA Region 9 maximum contaminant level (MCL) for PCE of 5 $\mu\text{g}/\text{L}$.

6.1.2 Trichloroethene

TCE was detected in groundwater samples obtained from four of the five monitoring wells sampled this quarter at concentrations ranging from 5.0 $\mu\text{g}/\text{L}$ in well MW-5 (duplicate sample) to 21 $\mu\text{g}/\text{L}$ in well MW-8. The detected concentrations of TCE in each of the four wells exceed the EPA MCL of 5 $\mu\text{g}/\text{L}$.

6.1.3 Cis-1,2-Dichloroethene

Cis-1,2-DCE was detected in the groundwater samples from wells MW-3 and MW-5 at concentrations of 0.72 $\mu\text{g}/\text{L}$ and 13/7.5 $\mu\text{g}/\text{L}$ (primary/duplicate samples), respectively. The detected concentrations of cis-1,2-DCE in the samples from well MW-5 exceed the EPA MCL of 6 $\mu\text{g}/\text{L}$.

6.1.4 1,1- Dichloroethene

1,1-DCE was detected in groundwater samples obtained from three of the five monitoring wells sampled this quarter at concentrations ranging from 0.94 µg/L in well MW-3 to 4.2 µg/L in well MW-7. The detected concentrations of 1,1-DCE do not exceed the EPA MCL of 6 µg/L

6.2 Data Quality Assessment

A review of the laboratory's internal QA/QC analysis of analytical method blanks, laboratory control standards (LCS) and matrix spike/matrix spike duplicate (MS/MSD) samples indicate no significant deviations from internal laboratory QC limits. Laboratory QA/QC data is included with the analytical data presented in Appendix B.

An evaluation of the precision of duplicate groundwater sample results through the evaluation of relative percent difference (RPD) between the sample (MW-5) and duplicate (MW-DUP) is presented in Table 4. As Table 4 indicates, the RPDs for the analytes detected in the groundwater samples are less than 55 percent.

6.3 GeoTracker Database

The fourth quarter 2008 groundwater monitoring report, analytical data, and depth to water data have been generated in electronic format for upload to the State Water Resources Control Board GeoTracker on-line database (<http://www.geotracker.swrcb.ca.gov>).

7 Discussion of Quarterly Results

A brief discussion of groundwater elevations and groundwater quality for this quarter is presented below.

7.1 Groundwater Elevation and Flow Direction

As noted previously, the interpreted direction of groundwater flow this quarter is generally to the southwest at a gradient of approximately 0.001. This flow direction is consistent with the flow direction observed over the last several years. A slight degree of mounding was again observed this quarter in the east-central portion of the site. Overall groundwater elevations decreased an average of 2.49 feet this quarter compared to the previous sampling event in August 2008. Groundwater elevations have fluctuated somewhat, but have decreased approximately 10 to 11 feet across the site since mid-2007 and are at or near historic lows in most wells. Wells MW-1 and MW-2 were essentially dry this quarter and could not be sampled.

7.2 Groundwater Quality and Remedial Analysis

The detections of chlorinated VOCs in groundwater samples from on-site monitoring wells continue to show a decreasing trend that is attributed to active source area remedial activities implemented since mid-2005 that have included soil vapor extraction (SVE) and enhanced in-situ bioremediation (EISB). The PCE concentration in well MW-3 was at a historic low last quarter and remains near historic lows this quarter. The PCE concentration in MW-2 was also near historic lows last quarter. TCE concentrations have also decreased to historic or near-historic lows in these wells. In addition, PCE concentrations in well MW-1 have decreased significantly since 2005 and were at a historic low in this well last quarter (MW-1 was dry this quarter and could not be sampled). The highest concentrations of PCE were found in well MW-5 and in off-site well MW-7 this quarter, although the concentration of PCE in MW-7 is at its lowest point since mid-2005. The time-series plots of VOCs (Appendix E) illustrate the substantial decreases in PCE concentrations in the on-site wells since mid-2002 and generally stable concentrations in the off-site wells.

The significant decreases in chlorinated VOC concentrations in groundwater since 2004 can be attributed to a combination of factors including natural attenuation, successful implementation of SVE remediation, and EISB injection activities. The significant decrease in groundwater elevation in 2004 (~10 feet) appears to have exposed the upper portion of the Gaspur Aquifer allowing natural attenuation of this unit and the lower portion of the overlying fine-grained soils. Additionally, based on the high hydraulic conductivity and transmissivity of the Gaspur Aquifer, natural attenuation by

dispersion and dilution are also expected to be occurring. As displayed on the time series plots (Appendix E) for wells MW-1, MW-2, MW-3 and MW-5, implementation of SVE in 2005 and EISB remediation in 2006 has been very effective at reducing chlorinated VOC concentrations on-site to the current historic lows. Mission's consultants have also identified a number of off-site sources of VOC and metal contamination affecting regional groundwater quality in the vicinity of the site including the Omega Superfund site that were reviewed with the RWQCB in January 2008. These off-site sources complicate interpretation of the chlorinated VOCs found in off-site areas.

8 Other Activities Completed This Quarter

CGC submitted the Third Quarter 2008 Groundwater Monitoring Report for the site on behalf of Mission on October 27, 2008. SGI performed additional work at the site during the fourth quarter 2008. Additional activities conducted included continued implementation of the corrective action activities for source area soil impacts and preparation of a remedial action plan. Work completed included the following:

- Evaluation of water level data to determine if the existing Vapor Extraction System (VES) could be operated with deeper screened VES wells.
- Preparation of draft Investigation Report and Remedial Action Plan.
- Call with the CRWQCB and follow up e-mail to assess the review status of SGI's August 2008 Soil Closure Sampling Workplan.

9 Limitations and Professional Certification

This report has been prepared for the exclusive use by Mission as it pertains to the former Mission facility located at 11904-11920 East Washington Street, Santa Fe Springs, California. Services have been performed using that degree of care and skill ordinarily exercised under similar circumstances by reputable qualified environmental consultants practicing at this or similar locations. No other warranty, either expressed or implied, is made as to any professional advice included in this report. These services were performed consistent with the agreement between CGC and Mission.

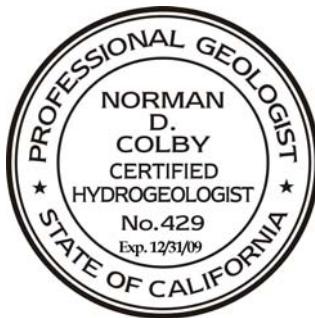

Opinions and recommendations contained in this report apply to conditions existing when services were performed and are intended only for the client, purposes, locations, time frames, and project parameters indicated. CGC and Environmental Risk Solutions, Inc. do not warrant the accuracy of information supplied by others, or the use of segregated portions of this report.

Sincerely,

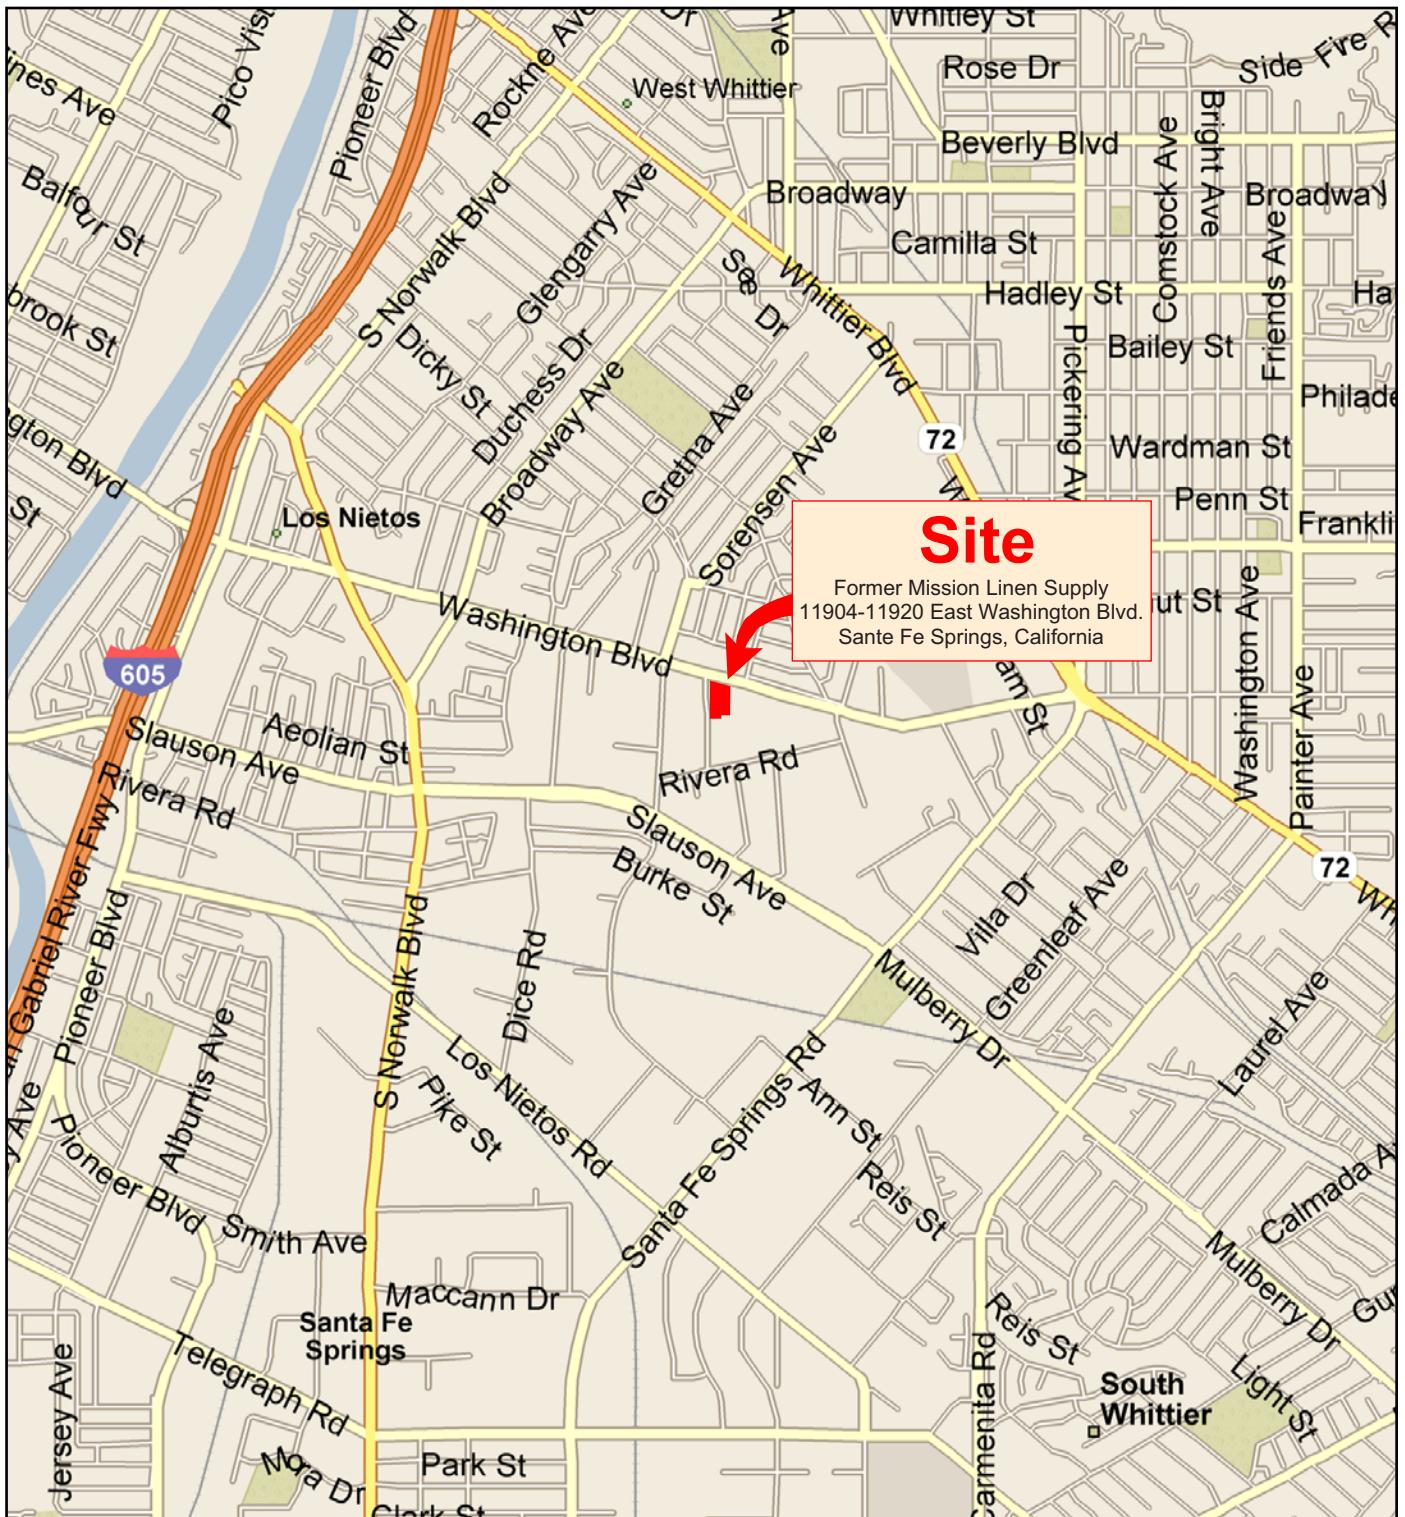

CGC Environmental, Inc.

SPH or Purge Water Drum Log

Client: CGC Environmental

Site Address: 11904 E Washington Blvd, Santa Fe Springs

STATUS OF DRUM(S) UPON ARRIVAL

Date	11-12-07	2-18-08	5-12-08	8/27/08	11/10/08	
Number of drum(s) empty:	2	1	2	2	5	
Number of drum(s) 1/4 full:	2	0	0	0	0	
Number of drum(s) 1/2 full:	-	0	0	0	6	
Number of drum(s) 3/4 full:	2	0	0	0	0	
Number of drum(s) full:	-	5	7	7	0	
Total drum(s) on site:	6	6	10	19	11	
Are the drum(s) properly labeled?	Yes	No water labeled	UNSURE	Unsure	Some	
Drum ID & Contents:	D-1, D-2, D-3 D-4 Purged H ₂ O	(labeled)	LABELS FADED	Labels FADED	Labels FADED	
If any drum(s) are partially or totally filled, what is the first use date:					4/1/08	

- If you add any SPH to an empty or partially filled drum, drum must have at least 20 gals. of Purgewater or DI Water.

-If drum contains SPH, the drum MUST be steel AND labeled with the appropriate label.

-All BTS drums MUST be labeled appropriately.

STATUS OF DRUM(S) UPON DEPARTURE

Date	11-12-07	2-18-08	5-12-08	8/27/08	11/10/08	
Number of drums empty:	2	1	2	2	5	
Number of drum(s) 1/4 full:	1	0	1	0	0

cc: Mr. Norm Colby

**Job Narrative
720-J16932-1**

Comments

No additional comments.

Receipt

One or more containers for the following sample(s) was received broken or leaking:
Received one voa broken for MW-3 and 2 voas broken for MW-4

The following sample(s) was received with headspace in the sample vial: MW-3

All other samples were received in good condition within temperature requirements.

GC/MS VOA

Method(s) 8260B: No MS/MSD due to filament burnt out.

No other analytical or quality issues were noted.

Question	T / F / NA	Comment
Radioactivity either was not measured or, if measured, is at or below background	N/A	
The cooler's custody seal, if present, is intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
There are no discrepancies between the sample IDs on the containers and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
VOA sample vials do not have headspace or bubble is <6mm (1/4") in diameter.	True	
If necessary, staff have been informed of any short hold time or quick TAT needs	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True

Notes

- 1) Existing wells (except piezometers) re-surveyed at same time as new wells on June 29, 2004
 - 2) Groundwater depth reported in feet below top of well casing
 - 3) Groundwater elevation reported in feet from mean sea level (msl)
- Table based on Rincon July 2004 quarterly report for data prior to 8/12/04
